Comp 3004: Neureset – Direct Neurofeedback EEG Device

Alvina Han, Aekus Trehan, James Yap, Lei Wu, Matthew Seto

Use Cases

Use Case 1: Turn Device On

<u>Primary Actor:</u> Device User <u>Scope:</u> Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset <u>Precondition:</u> User has a Neureset Device.

Minimal Guarantees: The device will not turn on if the battery is not charged.

Success Guarantee: The device has been turned on and is waiting on the main menu.

Main Success Scenario:

1. User presses the power button.

2. The device turns on.

Extensions:

2a. The device does not turn on.

• The user tries to charge the battery and if it still doesn't turn on, the device is faulty and the user contacts customer support.

Use Case 2: Turn Device Off

<u>Primary Actor:</u> Device User <u>Scope:</u> Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Precondition: User has a Neureset Device that is turned on.

Minimum Guarantees: Nothing happens.

Success Guarantee: The device has been turned off and is no longer consuming power.

Main Success Scenario:

- 1. User pressed the power button.
- 2. The device turns off.

Use Case 3: User Selects a Program

<u>Primary Actor:</u> Device User <u>Scope:</u> Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Precondition: User has a Neureset Device that is turned on and is on the main menu.

Minimum Guarantees: The device will turn off if it runs out of battery.

Success Guarantee:

The user has initiated one of the three programs of either:

- Starting a treatment
- Viewing past treatments
- · Change date and time.

Main Success Scenario:

- 1. User navigates through the menu and decides on what they want to do.
- 2. User selects their desired program by pressing a button.
 - a. User has selected to start a new session. Proceed to Use Case 4.
 - b. User has selected to View Past Session. Proceed to Use Case 5/6.
 - c. User has selected to Change Date and Time. Proceed to Use Case 7.

Use Case 4: User Treatment

<u>Primary Actor:</u> Device User <u>Scope:</u> Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Precondition:

- User has selected to start a treatment
- EEG electrodes contact is established (indicated by a blue light)

<u>Minimum Guarantees:</u> The device turns off if it runs out of battery or if electrodes are disconnected for too long.

<u>Success Guarantee:</u> The device has completed a treatment and logs the treatment into logged session/past treatments.

Main Success Scenario:

- 1. User contacts the Neureset and EEG electrodes are established.
- 2. User starts a new session.
- 3. Neureset device starts a timer.
- 4. Device displays session progress with an approximate time remaining and a percentage progress bar.
- 5. Electrodes read a signal from one of the 21(7) sites on the headset.
- 6. Device establishes a baseline average frequency.
- 7. Devices add an offset frequency of 5hz to the baseline frequency.
- 8. Device recalculates baseline frequency after the addition of the offset.
- 9. Device repeats step 5 until total offset frequency added is 20hz.

- 10. Repeat step 4 for each of the Electrodes.
- 11. Session ends when the timer reaches zero.
- 12. Device notifies the user that the treatment has been completed.
- 13. Device logs the previous treatment to the database (Past Treatments).

Extensions:

- 1a. Proceed to Use Case 9: Connection Lost Between Electrodes and the Device.
- 2ai. Users can voluntarily pause the session by pressing the pause button.
- 2aii. If contact is not reestablished within 5 minutes of pausing, the device automatically terminates the session and turns off.
- 2b. If the session is interrupted due to external factors (e.g., power outage), the device saves session progress and prompts the user to resume or start a new session upon power restoration.

Use Case 5: User View Past Treatments On Neureset

Primary Actor: Device User

Precondition:

- The device treatment has just concluded
- User selects View Past Treatments from the menu

Scope: Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Minimum Guarantee: A blank page is displayed when no previous treatments have been completed.

Success Guarantee: The device will display all the previous treatments completed.

Main Success Scenario:

- 1. Device displays the past treatments with timestamps (date and time).
- 2. User navigates the past treatments using a scroll.
- 3. When the user is done, they can press a different tab.

Use Case 6: User View Past Treatments on PC

Primary Actor: Device User

Precondition:

- The device treatment has just concluded
- User selects View Past Treatments from the menu

Scope: PC Device Level: User Goal

Stakeholders and Interests:

PC User - wants to utilize PC to see baselines of past treatments

Minimum Guarantee: A blank page is displayed when no previous treatments have been completed.

Success Guarantee: The device will display all of the previous treatments completed.

Main Success Scenario:

1. Device displays the past treatments with timestamps (date and time).

- 2. User ensures that the Neureset is plugged into the PC.
- 3. User presses the sync changes button.
- 4. The Neureset will sync with the computer and upload its previous sessions with baselines.
- 5. User can now view past treatments with the timestamp and the starting and end baselines.

Use Case 7: User Changes Time and Date

Primary Actor: Device User

Precondition: User selects Set Time and Date from menu

Scope: Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Minimum Guarantee: The time and date remain unchanged on the device.

Success Guarantee: The time and date are changed on the device.

Main Success Scenario:

1. Device displays a time/date to the user.

- 2. The user can input a new time.
- 3. The device updates the display at the new updated time.
- 4. The new time should be reflected within new session logs.

Use Case 8: Battery Low Response of the Device

Primary Actor: Device User

Precondition: The device is low on battery

Scope: Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

Minimum Guarantee: A blank page is displayed when no previous treatments have been completed.

Success Guarantee: The device will display all of the previous treatments completed.

Main Success Scenario:

- 1. Device battery is low.
- 2. Device battery is updated to showcase low battery.
- 3. Device displays text and audio to tell the user to charge the device.

Use Case 9: Connection Lost Between Electrodes and the Device

Primary Actor: Device User

Precondition:

- The device is performing a treatment
- Connection is lost between Electrodes and the Device

Scope: Neureset Device

Level: User Goal

Stakeholders and Interests:

Neureset User - wants to utilize Neureset

<u>Minimum Guarantee:</u> The device turns off and the session is terminated.

<u>Success Guarantee:</u> The device will continue performing the treatment.

Main Success Scenario:

- 1. Device loses contact with EEG electrodes.
- 2. The device flashes a red light.
- 3. The device pauses the session.
- 4. The display displays an error message and prompts the user to check electrode connections.
- 5. The device starts beeping until contact is reestablished.

Extension:

4a. If contact is not reestablished within 5 minutes, the device automatically turns off, and the session is terminated.

Figure 1: Use Case Diagram

It is mandatory for the user to turn the device on for executing any of the cases.

Design Documentation

All diagrams are in their respective diagram folders under "Diagrams+Report" folder for reference (in GitHub).

- Sequence Diagram
- State Diagram

- (Use Case Diagram)

UML Class Diagram

Figure 2: UML Class Diagram

The two main entities are Neureset Controller and EEG Simulator. The EEG Simulator is focused on the EEG waves and the offsets during the main scenario, user treatment. The Neureset Controller is a controller that controls the small entities that make up the device. Not a specific design is implemented but we have separated the functionalities into two: one handling the treatment and one that handles everything else.

Sequence Diagram

UC1: Turn Device On

Figure 3 is success scenario of Use Case 1. It is a success scenario when an actor, user, presses the power button and once the device checks that it is not out of battery, it will turn on. One thing to note here is that it is assumed that the device can be turned off in middle of the session so once the device is turned on again, the session will be terminated and need to be restarted.

Figure 4 is success scenario of Use Case 2. It is a success scenario when an actor, user, presses the power button and once the device checks that it is not out of battery, it will turn off. One thing to note here is that it is assumed that the device can be turned off in middle of the session and if it does, it will end the session. Also, if contact is made at the point of turn off, the device will break contact with the user.

Figure 5 is success scenario of Use Case 4. It is a success scenario when an actor, user, receives treatment. First, the user gets in contact with the device and the corresponding EEG plot and set ups will be in place. Once the user starts the session, the baseline will be calculated, and following offsets will be added every round. After it executes four more times, the final baseline will be outputted, and the final offset will be saved. Then, the session will be added to the log. Note that throughout the treatment, battery is depleted, and it is twice as fast as when not in session.

Neureset Battery PC Electrodes EEG Simulator Session Logger

User clicks on the view History Tab

getLogEntries

UC5: Therapy History Viewing with Neureset

Figure 6 is success scenario of Use Case 5. It is a success scenario when an actor/user presses the view History Tab on the Neureset device. The device will go and ask the session logger which will display all the log entries. Here the log entries only display the date and time of treatments which would be the current time of using the machine or the manually set time had the user set their own time. If there are no log entries, then it will just display a blank page. Within this scenario, we assume that the user has the device powered on and is on the main menu.

UC6: Therapy History Viewing with PC

Figure 7 is a success scenario of Use Case 6. It is a success scenario when an actor/user presses the sync change button on the PC. We assume here that the Neureset device is plugged in/mounted onto the PC. The PC will go and ask the session logger for the log entries and then it will sync and display all log entries. Here the log entries have the starting baseline and ending baseline alongside the date and time of treatments which would be the current time of using the machine or the manually set time had the ser set their own time. If there are no log entries, then it will just display a blank page. Within this scenario we assume that the user has the PC powered on.

User clicks on the "Set Clock" tab

user inputs a date and time

setDateTime
toggleClockSetting

UC7: User Changes Time and Date

Figure 8 is a success scenario of Use Case 7. It is a success scenario when the actor/user presses on the "Set Clock" tab on the menu on the Neureset device. The Neureset will then get its current date and time.

But then if a user inputs a date and time, the Neureset will set the date and time and then toggle (sync) the clock setting for all other features within the Neureset. Within this scenario we assume that the user has the device powered on and on the main menu.

UC8: Battery Low Response

Figure 9 is a success scenario of Use Case 8. It is a safety scenario when the Neureset device is low on battery. Every second, the Neureset will lose battery and more when in use. After a certain threshold of the battery being low, it will announce that the battery is low through audio and text in the device. Eventually, the battery will run out and the device will turn off. If the device is in session while it runs out of battery, it will try to end the session and save progress before powering off.

Note that battery lasts 180 seconds at 100%. When not in session, the battery life goes down by 1 every second and during the session, it is doubled to 2 every second. If the device is off, battery stays constant.

UC9: Connection Lost between Electrodes and the Device

Figure 10 is a success scenario of Use Case 9. It is a safety scenario when the connection between the user and the device is lost. When the user breaks contact with the device in the middle of a session, the treatment is paused, and the red light starts flashing. If the contact is reestablished within 5 seconds (5 minutes in real device), the treatment is resumed. However, if contact is not reestablished within 5 seconds, the session will terminate and it will go back to the main menu, where it prompts the user to contact the device.

State Diagram

Figure 11 is a state diagram for the Neureset Device for most of the functionalities other than the session log. Note that "Date/Time Change", and display of "past treatments" can be viewed except when in session.

Figure 12 is a state diagram for the connected PC. It will sync session logs and display treatment history on the PC screen.

Traceability Matrix

ID	Requirement	Related Use Case	Fulfilled By	Tested by	Description
1	The Neureset interface contains buttons, display, and electrodes.	N/A	Mainwindow.ui	Run the simulator in Qt. View the UI that is titled "Neureset Device"	Reconstructed the physical Neureset device system using QT's built in UI framework.
2	The PC interface has a button to sync changes and a display for past treatments.	Therapy History Viewing with PC (UC 6)	pcwindow.ui	Run the simulator in Qt. View the UI that is titled "Connected PC"	Reconstructed a PC interface that has a QPushButton that simulates synchronizing the PC Window with the NeuresetController device. This is done because the PCWindow does not have direct access to the SessionLogger object, and must rely on interfacing with the NeuresetController to extract the LogEntry data objects.
3	The application battery level is dependent on time and whether the device in is session or not.	Turn Device On (UC 1) Battery Low Response (UC 8)	Battery, Neureset Controller	Run the simulator in Qt. In the "Neureset Device" UI, view the battery in the bottom right when the device is turned on – will visually go down as well as gives updates for every 10% decrease in the output logs	Used QTimer to track time passed, whenever time passes, the battery is decreased starting from 3 minutes going down every second. If the device is off, battery level will not change, if on but not in session, will go down by one and if in session then the battery will go down twice as fast.
4	Treatment cannot start unless user	User Treatment (UC 4)	Mainwindow.ui Electrode, EEG simulator, Neureset Controller	Run the simulator in Qt. In the "Neureset	Tracks if contact is made through the "make contact" / "break contact" button which will be toggled to one or the

When a session is started you can also see more specifics on the waveforms printed in the program output.	also reading each electrode's configured public member variables to determine the MAX_AMPLITUDE and MIN_AMPLITUDE for the sin wave generation.
A realistic EEG waveform is displayed during the treatment process	N/A	Mainwindow.ui Neureset Controller, EEG Simulator, Electrode	Run the simulator in Qt. In the "Neureset Device" UI, when contact is simulated to the device and a session is in progress, there is a waveform displayed as well as a yellow overwritten wave when treatment is in progress showing the waveform during the treatment process.	In the "defs.h" a constant called NOISE_FACTOR can be configured to increase or decrease the noise level artificially induced into the system. The Electrode class then makes use of QRandomGenerator::global()->generateDouble() * NOISE_FACTOR to simulate noise, causing the waveforms to appear more organic and realistic.
